

# Building information modeling (BIM) in data centers

With BIM, a data center can be optimized from the beginning. You can start with a solid data base and don't need to make inventories.

Our solution Datacenter Clarity LC™ combines data center infrastructure management (DCIM) with the BIM process and therefore helps you to benefit from increased efficiency and flexibility in you data center.

## 1. Plan and build together

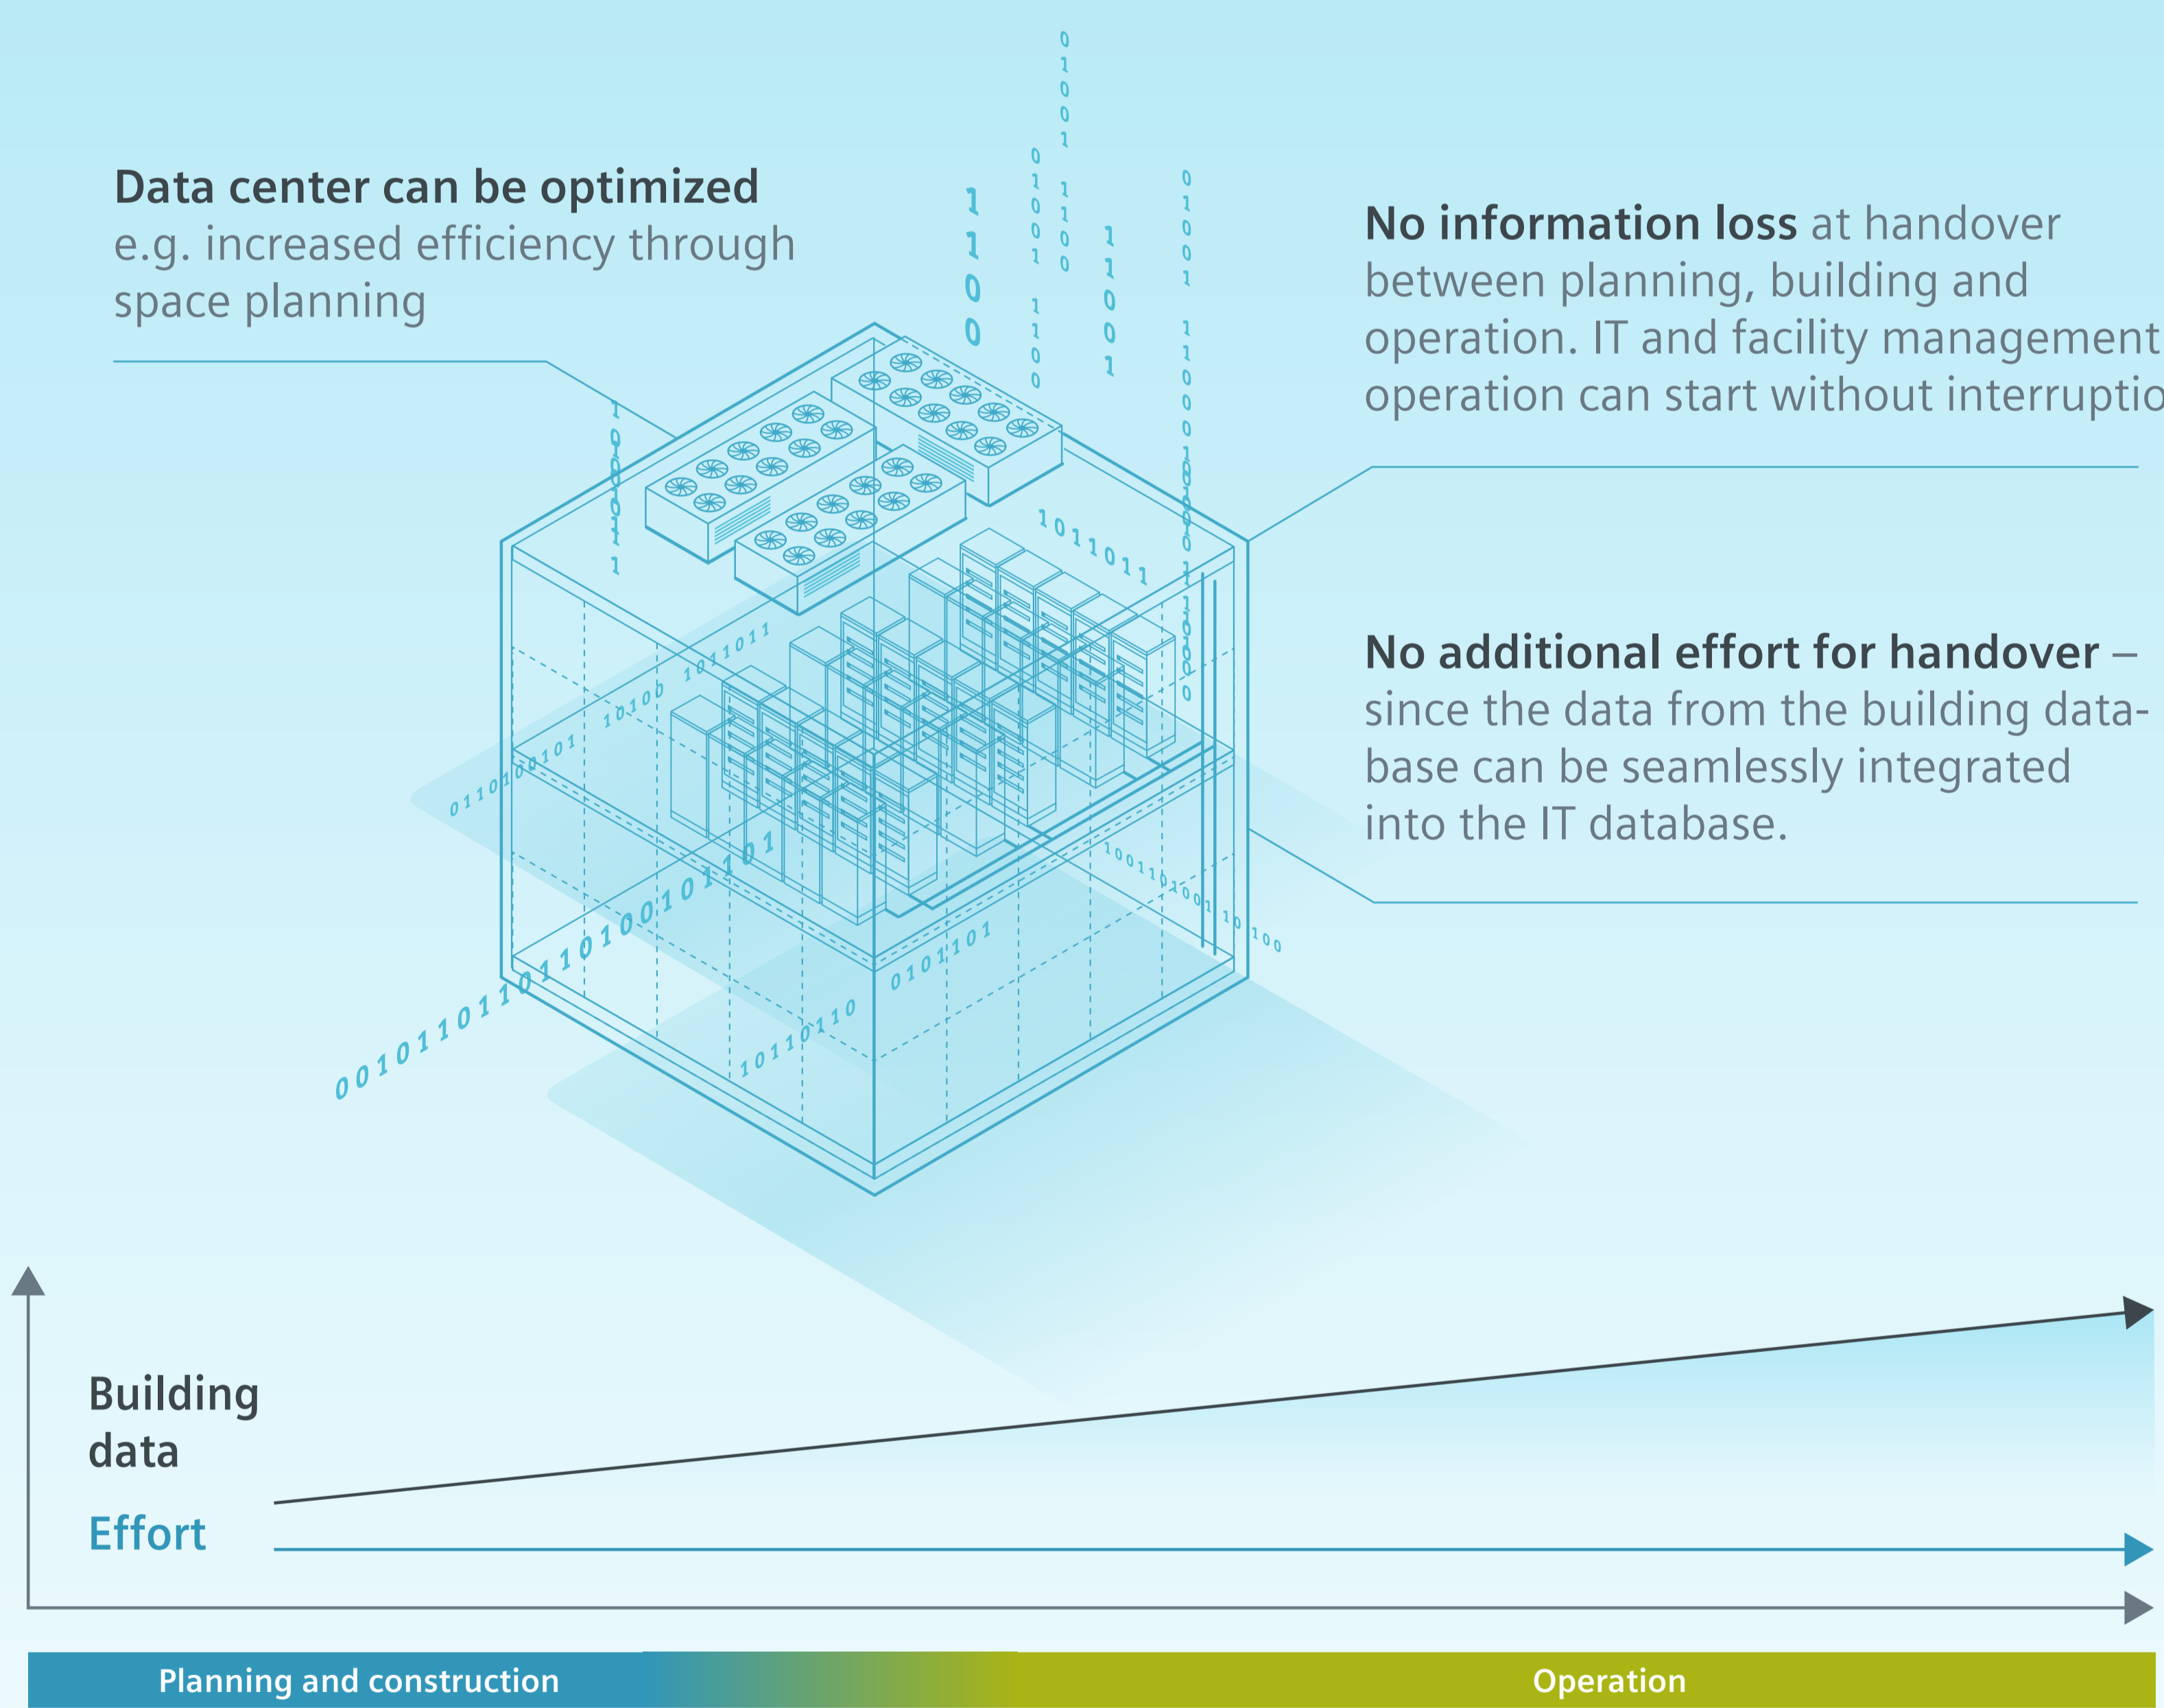

## 2. Create a solid building data base – a digital twin – with BIM

**Data center can be optimized**  
e.g. increased efficiency through space planning

**No information loss** at handover between planning, building and operation. IT and facility management operation can start without interruption.

**No additional effort for handover** – since the data from the building data base can be seamlessly integrated into the IT database.

## 3. Operate data center based on solid data base
