

Important information

If SIPROTEC 5 Devices are connected with IEC 61850 to SICAM PAS and Synchro-Check shall be used for Circuit Breakers please consider the following information.

DIGSI 5 V6.00 uses per default

- IEC 61850 Edition 1 and therewith
- the SIPROTEC 4 data model (“SIPROTEC 4 similar view” in the “Structure Editor”)

Based on the resulting information in the SCL-files it can happen that SICAM PAS cannot recognize reliably the need for synchronized switching of the Circuit Breakers.

In order to avoid unintended command outputs (without Synchro-Check) please make sure that prefix and instance number of the Circuit Breaker’s logical nodes “CSWI” and “XCBR” are identical and not empty.

This measure is sufficient for SICAM PAS Versions V7 and V8.

If a SIPROTEC 5 device shall be connected to SICAM PAS V5 or V6, please contact the Customer Support Center.
