1 INTRODUCTION

1.1 Background

Siemens China manufactures digital equipment that can be used in substations. Siemens has implemented the IEC 60870-5 Telecontrol Companion Standard 104 in the SIPROTEC Compact Feeder Protection 7SC80 product for communication with a controlling system. The IEC 60870-5 Telecontrol Companion Standard 104 (TCS104) can be used as a communication protocol for exchanging information between Control Center(s) (controlling station) and substations (controlled stations). The information exchanged can be for example measurands, status messages and commands.

DNV GL's assignment was to answer the following question:

"Is the Siemens IEC 60870-5-104 controlled station protocol implementation (IEC 104 Application software version 1.20 for the SIPROTEC Compact Feeder Protection 7SC80 conform to the IEC 60870-5-104 Companion Standard in Standard Direction and the EDP-Energias de Portugal Light Protocol Implementation Document for IEC 60870-5-104, version 1.1?"

To answer this question, DNV GL has performed a conformance test on the Siemens IEC 60870-5-104 controlled station protocol implementation in the SIPROTEC Compact Feeder Protection 7SC80.

1.2 Testing viewpoints

There are two common viewpoints for testing communication protocol implementations: *Conformance testing* and *Interoperability testing*.

The first testing viewpoint, *Conformance testing***,** is the process of verifying that an implementation performs in accordance with a particular standard. A manufacturer may claim: "*my equipment conforms to standard ISO/IEC xxx-x*". Conformance testing enables such a claim to be investigated and assessed by an objective and independent institute, like DNV GL, to establish its validity. The type test may result in an Attestation of Conformity, guaranteed by DNV GL, for the tested implementation version in that equipment. DNV GL maintains a list of type-tested and approved equipment with IEC 60870-5 implementations (see www.dnvkema.com/pctc).

Conformance testing extends the normal conformance test process by adding negative and boundary test items to the testing process.

The second viewpoint, Interoperability testing (IOP), shows whether or not a protocol implementation, installed in one product, can be used to exchange information with another product which has implemented the same protocol. No direct attention is paid to the implementation of the protocol itself. After completion of the tests, there is no guarantee that the protocol implementation is in accordance with that particular standard. It is clear, however, whether or not the protocol functions required in order to exchange information can work together to accomplish the required task.

This document describes the result of a Conformance test. Although a positive outcome of the test is a proof of independent verification (according to the applicable test procedures), it does not guarantee complete interoperability with other devices. Even when the same protocol options are implemented in two devices (see PICS), some further fine configuration may be necessary to guarantee complete interoperability.

1.3 Purpose of this document

The purpose of this document is to describe the results of the type test of the IEC 60870-5-104 implementation in the System Under Test (further SUT). The type test was executed at Siemens, China, from April 7th till April 11th 2015. The results will form the basis for an (potential) Attestation of Conformance. This Attestation is primarily of interest to product marketers and customers, as a proof of independent verification of minimized interoperability risks.

1.4 Contents of this document

Chapter 2 shows the list of relevant normative and other references, used to provide input for the type test.

Chapter 3 describes the various relevant components for the type test and their configuration as used in the conformance test, including the System Under Test. This chapter also gives an overview and introduction to the various test groups that together constitute the type test.

Chapter 4 and 5 give an overview and summary of the test results, the conclusion(s) and recommendations. The summary contains a **Defects** and a **Remarks** entry next to each group of test cases.

Appendix A specifies the detailed test cases and their outcome, appendix B contains detailed comments on test results, for instance when a defect is detected, including the actual message flow if appropriate.

1.5 Glossary

- SUT = System Under Test[1].
- PICS = Protocol Implementation Conformance Statement. A template document (IEC 60870-5 104 ed.2 Clause 9 – Interoperability) where all the basic characteristics of an IEC 60870-5-104 ed.2 implementation are stated
- PID = Protocol Implementation Document. A document issued by a manufacturer or system integrator where on top of the PICS template, additional detailed information regarding requirements and fine options is added.

[1] This can either be an embedded device or an industrial pc.

3 INTRODUCTION

3.1 Components in the test environment

The test environment consists of the following components:

- the SUT: the SIPROTEC Compact Protection Feeder 7SC80 controlled station implementation featuring IEC 104 Application software version 1.20 running with the device firmware version V04.20.04
- the DNV GL *UnIECim 104* version 2.0.1 (2014) protocol test system and simulator, which runs the TCS104 simulator test suite version 1.43 and acts as a single-node Controlling station
- the DNV GL *UniECom 104* version 3.0.0 (2014) protocol test analyser
- RJ45 100 Mb cables
- a switch or hub.

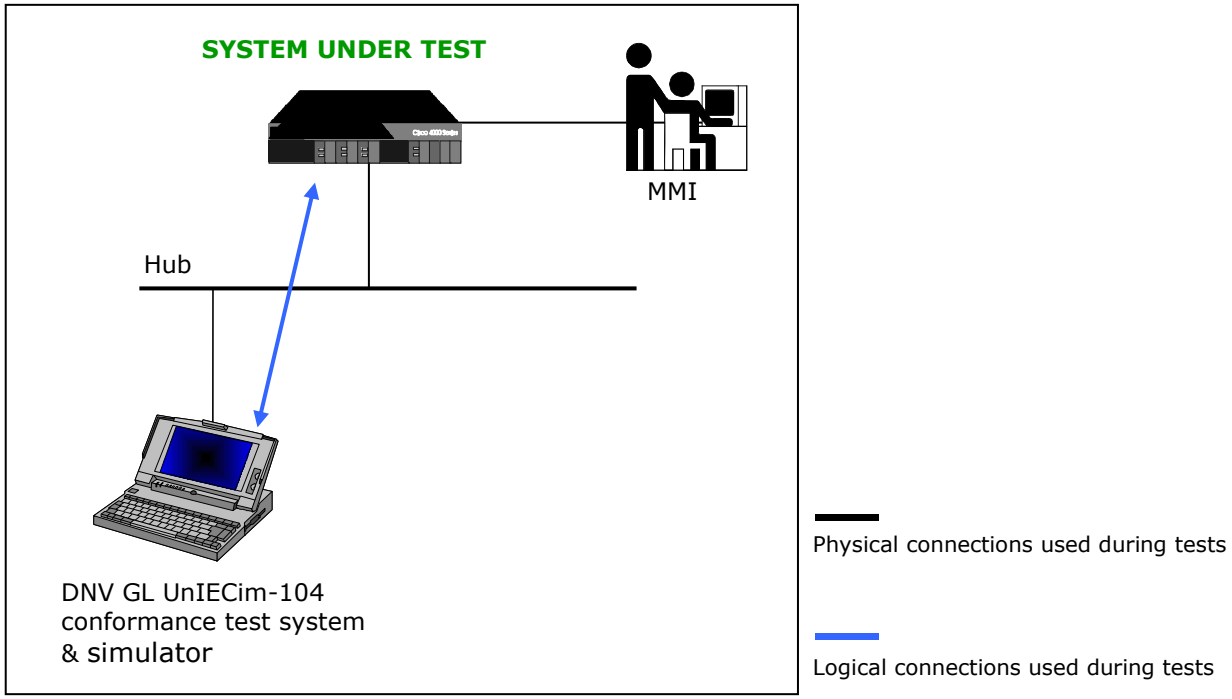

Figure 3-1 Connection and set up of the test environment

3.2 SUT requirements

Next to the CS104 communication capability specified in the PID, the SUT must support the following requirements for control and simulation purposes during testing, e.g. via additional test equipment attached to the SUT or one or more configured and running operator MMI stations:

- display the current values of the Information Elements described in I/O list, mapped to visible MMI-elements
- manually pause/freeze (or equivalent, e.g. extending timers) of the communication to verify displayed or analysed data
- manually shut down and restart or equivalent
- manually cut-off of the connection to the communication link
- manually activate the supported Basic Application Functions
- direct physical connection to the communication link.

3.3 SUT configuration

The configuration of the SUT is as follows:

- the telecontrol communication mode is balanced (by definition) peer-to-peer, capable of using a Wide Area TCP/IP network (see also figure 3.1)
- the configured IP addresses were:
  - SUT 192.168.0.11
  - Test system: 192.168.0.12
- common Address of ASDU (CAA) used during the test was 1
- further details of the implemented protocol (interoperability sheet) subset can be found at Chapter 0 Protocol Implementation Conformance Statement (PICS)
- the PICS forms the basis for the applicable test cases in the test plan in Appendix A.

3.4 UnIECim test system

The UnIECim IEC 60870-5 protocol test suite consists in DNV GL's test tools for testing IEC 60870-5 protocol implementations. The knowledge of the IEC 60870-5 protocol is in the software and it does support the test engineer.

UnIECim supports real-time data capturing, analysis and decoding, combined with construction of frames and real-time script execution for simulation of conforming (positive) as well as non-conforming (negative) communication functions. UnIECim automatically executes all scripts (test cases) in a so-called test suite.

UnIECim 104 is simulator and test system (active) for testing Controlling or Controlled station implementations based on the IEC 60870-5 Telecontrol Companion Standard 104 (TCS 104): network access for IEC 60870-5-101, including redundancy functionality.

UnIECom 104 is the analyser (passive) for testing Controlling or Controlled station implementations based on the IEC 60870-5 Telecontrol Companion Standard 104 (TCS 104): network access for IEC 60870-5-101, including redundancy functionality and showing lower layer (TCP, IP) decoded data.

3.5 Overview of the test suite

3.5.1 Tests on Transport provider level

For information exchange between both end systems a TCP/IP network is used. Tests in table A.1 verify that end systems can establish a TCP/IP connection, are able to exchange (CS104) messages and the TCP/IP connection doesn't fail permanently. White-box (internal) TCP/IP and lower tests are *not* performed. The tests are passed if no error is reported during a test session.

If relevant, redundant link tests are defined in Appendix A, table A.11.

3.5.2 Tests on application level

Most of the Application Service Data Units (ASDUs) tests defined in Appendix A are automatically performed by *UnIECim 104* and *UnIECom 104* on each received ASDU if applicable. The tests are passed if no defect is reported during the test session.

The Basic Application Functions (BAFs) tests defined in Appendix A are performed by a combination of automatic verification and manual expert analysis for each applicable test case. The tests are passed if no defect is found during the test session.

3.5.3 Negative tests

The Negative tests defined in Appendix A, table 24 are performed by a combination of automatic verification and manual expert analysis for each test case if applicable. The tests have passed if the SUT continues correct operation, that is: does not send corrupted frames and reacts in a correct and sensible manner.

The SUT may not fail permanently when receiving:

- corrupted frames
- illegal functions
- not supported functions
- not supported Basic Application Functions (BAF) or ASDU's.

4 TEST RESULTS

Appendix A provides a summary of the test results. Numbers shown in the table refer to test numbers of individual test cases in IEC 60870-5-604. If applicable, an end note describing a defect is added in appendix A.

Defects are a certain cause for operational risks: these MUST be corrected before going into an operational situation! They imply the overall test outcome to be **failed.**

Remarks introduce additional observations about the test case results, like limitations in the implementation or implementation choices.

The PICS in Chapter 0 is the basis for the applicable test cases in Appendix A. The PICS gives an overview of the tested protocol implementation, but this isn't a guarantee that the complete function or ASDU, as enabled in the PICS, is tested and supported. Partial testing is possible and the completeness of the tests for the specific function or ASDU must be consulted in Appendix A.

Table 1 Summary of the test results

Test group	Defects	Remarks	Verdict
0. Configuration parameters		-	Passed
1. Transport provider level		5.3.1.50 (2), 5.3.1.90	Passed with Remark
2. Data Unit Identifier			Passed
3. ASDUs for Process information in monitor (normal) direction		5.3.3.10, 5.3.3.30, 5.3.3.50, 5.3.3.130, 5.3.3.210, 5.3.3.230, 5.3.3.250, 5.3.3.370	Passed
4. ASDUs for Process information in control (normal) direction		5.3.4.1, 5.3.4.10, 5.3.4.20, 5.3.4.110	Passed
5. ASDUs for system information in monitor direction		5.3.5.1	Passed
6. ASDU for system information in control (normal) direction		-	Passed
7. ASDU for parameters in control (normal) direction		-	Passed
8. ASDU for file transfer in monitor and control direction		-	Passed
9. Data Unit Identifier		-	Passed
10. Information object address		-	Passed
11. Station initialisation		-	Passed
12. Redundant connection tests		-	N.A.
13. Cyclic data transmission		-	N.A.
14. Data acquisition through Read		-	N.A.
15. Acquisition of events		-	Passed
16. General interrogation		5.4.16.1	Passed
17. Clock synchronisation		-	Passed
18. Command transmission		5.4.18.70	Passed
19. Transmission of integrated totals		5.4.19.1	Passed
20. Parameter loading		-	Passed
21. Test procedure		-	Passed
22. File Transfer		-	Passed
23. Additional tests		-	Passed
24. Negative tests		5.4.24.1, 5.4.24.2	Passed with Remark
25. PIXIT related		5.4.25.100	Passed
TOTAL	**0**	**22**	**Passed**

* N/A = Not Applicable

5 CONCLUSION AND RECOMMENDATIONS

The assignment was to give a well-founded answer to the question:

"Does the Siemens IEC 60870-5-104 controlled station protocol implementation (IEC 104 Application software version 1.20 for the SIPROTEC Compact Feeder Protection 7SC80 conform to the IEC 60870-5-104 Companion Standard in Standard Direction and the EDP-Energias de Portugal Light Protocol Implementation, version 1.1?"

Based on the test results described in this report, DNV GL declares the tested Siemens CS104 controlled station implementation for the SIPROTEC Compact Protection Feeder, **in conformance** with the IEC 60870-5-104 standard [IEC 5-104] and the [PICS] for the tested configuration.

5.1 Exceptions with the [PICS]

There are no exceptions. All functionality is implemented and tested.

5.2 Remarks and Recommendations following from the test

The following comments and recommendations apply:

- K and W can be configured for values up to 255 only while maximum range is 32767. It is recommended to implement maximum range in order to allow transmitting as much frames as possible without confirmation for the case that big amount of information need to be sent from Controlled station.
- IV bit is supported only. NT bit can be set by configuration for Double Point information only. It is recommended to extend the use of quality bit to the maximum in order to provide the controlling station with the most reliable information.

6 PROTOCOL IMPLEMENTATION CONFORMANCE STATEMENT (PICS)

The Protocol Implementation Conformance Statement (PICS) in this paragraph is the basis for the applicable test cases in Appendix A. This PICS gives an overview of the tested protocol implementation, but this isn't a guarantee that the complete function or ASDU, as enabled in the PICS, is tested and supported. Partial testing is possible and the completeness of the tests for the specific function or ASDU must be consulted in Appendix A.

Note:
In addition, the full specification of a system may require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

The selected parameters should be marked in the white boxes as follows:

☐	Function or ASDU is not used
X	Function or ASDU is used as standardized (default)
R	Function or ASDU is used in reverse mode
B	Function or ASDU is used in standard and reverse mode

The possible selection (blank, X, R, or B) is specified for each specific clause or parameter.

A black check box indicates that the option cannot be selected in this companion standard.

6.1 System or device

(system-specific parameter, indicate definition of a system or a device by marking one of the following with '**X**')

☐	System definition
☐	Controlling station definition
X	Controlled station definition

6.2 Network configuration

(network-specific parameter, all configurations that are used are to be marked '**X**')

■	~~Point-to-point~~	■	~~Multipoint-partyline~~
■	~~Multiple point-to-point~~	■	~~Multipoint-star~~

6.3 Physical layer

(network-specific parameter, all interfaces and data rates that are used are to be marked '**X**')

Transmission speed (control direction)

Unbalanced interchange Circuit V.24/V.28 Standard	Unbalanced interchange Circuit V.24/V.28 Recommended if >1 200bit/s	Balanced interchange Circuit X.24/X.27	
■ ~~100 bit/s~~	■ ~~2 400 bit/s~~	■ ~~2 400 bit/s~~	■ ~~56 000 bit/s~~
■ ~~200 bit/s~~	■ ~~4 800 bit/s~~	■ ~~4 800 bit/s~~	■ ~~56 000 bit/s~~

■ ~~300 bit/s~~
■ ~~600 bit/s~~
■ ~~1 200 bit/s~~
■ ~~9 600 bit/s~~
■ ~~9 600 bit/s~~
■ ~~19 200 bit/s~~
■ ~~38 400 bit/s~~
■ ~~64 000 bit/s~~

Transmission speed (monitor direction)

Unbalanced interchange Circuit V.24/V.28 Standard	Unbalanced interchange Circuit V.24/V.28 Recommended if >1 200bit/s	Balanced interchange Circuit X.24/X.27	
■ ~~100 bit/s~~	■ ~~2 400 bit/s~~	■ ~~2 400 bit/s~~	■ ~~56 000 bit/s~~
■ ~~200 bit/s~~	■ ~~4 800 bit/s~~	■ ~~4 800 bit/s~~	■ ~~56 000 bit/s~~
■ ~~300 bit/s~~	■ ~~9 600 bit/s~~	■ ~~9 600 bit/s~~	■ ~~64 000 bit/s~~
■ ~~600 bit/s~~		■ ~~19 200 bit/s~~	
■ ~~1 200 bit/s~~		■ ~~38 400 bit/s~~	

6.4 Link layer

(network-specific parameter, all options that are used are to be marked 'X'. Specify the maximum frame length. If a non-standard assignment of class 2 messages is implemented for unbalanced transmission, indicate the Type ID and COT of all messages assigned to class 2.)

~~Frame format FT 1.2, single character 1 and the fixed time out interval are used exclusively in this companion standard.~~

Link transmission

■ ~~Balanced transmission~~
■ ~~Unbalanced transmission~~

Frame length

■ ~~Maximum length L (number of octets)~~

Address field of the link

■ ~~not present (balanced transmission only)~~
■ ~~One octet~~
■ ~~Two octets~~
■ ~~Structured~~
■ ~~Unstructured~~

When using an unbalanced link layer, the following ASDU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

■ ~~The standard assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission
9, 11, 13, 21	<1>

■ ~~A special assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission

~~Note: (In response to a class 2 poll, a controlled station may respond with class 1 data when there is no class 2 data available).~~

6.5 Application layer

Transmission mode for application data

Mode 1 (Least significant octet first), as defined in clause 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common address of ASDU

(system-specific parameter, all configurations that are used are to be marked '**X**')

■ ~~One octet~~ [X] Two octets

Information object address

(system-specific parameter, all configurations that are used are to be marked '**X**')

■ ~~One octet~~ [ ] Structured

■ ~~Two octets~~ [X] Unstructured

[X] Three octets

Cause of transmission

(system-specific parameter, all configurations that are used are to be marked '**X**')

■ ~~One octet~~ [X] Two octets (with originator address) Originator address is set to zero if not used

Length of APDU

(system-specific parameter, specify the maximum length of the APDU per system)

The maximum length of the APDU for both directions is 253. It is a fixed system parameter.

[ ] Maximum length of APDU per system in control direction

[ ] Maximum length of APDU per system in monitor direction

Selection of standard ASDUs

Process information in monitor direction

(station-specific parameter, mark each Type ID '**X**' if it is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

Parameter in control direction

(station-specific parameter, mark each Type ID '**X**' if it is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

[ ]	<110>	:=	Parameter of measured value, normalized value	P_ME_NA_1
[ ]	<111>	:=	Parameter of measured value, scaled value	P_ME_NB_1
[X]	<112>	:=	Parameter of measured value, short floating point value	P_ME_NC_1
[ ]	<113>	:=	Parameter activation	P_AC_NA_1

File Transfer

(station-specific parameter, mark each Type ID 'X' if it is only used in the standard direction, 'R' if only used in the reverse direction, and 'B' if used in both directions)

[X]	<120>	:=	File ready	F_FR_NA_1
[X]	<121>	:=	Section ready	F_SR_NA_1
[X]	<122>	:=	Call directory, select file, call file, call section	F_SC_NA_1
[X]	<123>	:=	Last section, last segment	F_LS_NA_1

X	<124>:=	Ack file, ack section	F_AF_NA_1
X	<125>:=	Segment	F_SG_NA_1
X	<126>:=	Directory {blank or X, only available in monitor (standard) direction}	F_DR_TA_1
	<127>:=	Query log – Request archive file	F_SC_NB_1

Type Identifier and Cause of Transmission Assignments

(station-specific parameters)

Shaded boxes are not required.

Black boxes are not permitted in this companion standard.

Blank = Function or ASDU is not used.

Mark Type Identification/Cause of transmission combinations:
'**X**' if only used in the standard direction
'**R**' if only used in the reverse direction
'**B**' if used in both directions.

Type Identification		Cause of transmission

Basic application functions

Station initialization

(station-specific parameter, mark '**X**' if function is used)

[X] Remote initialization

Cyclic data transmission

(station-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

[ ] Cyclic data transmission

Read procedure

(station-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

[ ] Read procedure

Spontaneous transmission

(station-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

[X] Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous

(station-specific parameter, mark each information type '**X**' where both a Type ID without time and corresponding Type ID with time are issued in response to a single spontaneous change of a monitored object).

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

[ ] Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1

[ ] Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1

[ ] Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1

[ ] Bitstring of 32 bit M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1 (if defined for a specific project)

[ ] Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1

[ ] Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1

[ ] Measured value, short floating point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

Station interrogation

(station-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] global
- [ ] group 1
- [ ] group 2
- [ ] group 3
- [ ] group 4
- [ ] group 5
- [ ] group 6
- [ ] group 7
- [ ] group 8
- [ ] group 9
- [ ] group 10
- [ ] group 11
- [ ] group 12
- [ ] group 13
- [ ] group 14
- [ ] group 15
- [ ] group 16

Information Object Addresses assigned to each group must be shown in a separate table

Clock synchronization

(station-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] Clock synchronization
- [ ] Day of week used
- [ ] RES1, GEN (Time tag substituted/not substituted) used
- [X] SU-bit (summertime) used

Optional, see clause 7.6.

Command transmission

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] Direct command
- [X] Direct set point command transmission
- [X] Select and execute command (Only for the commands without timetag)
- [X] Select and execute set point command (Only for the commands without timetag)
- [X] C_SE ACTTERM used

- [X] No additional definition
- [X] Short pulse duration (duration determined by a system parameter in the outstation)
- [X] Long pulse duration (duration determined by a system parameter in the outstation)
- [X] Persistent output

- [X] Supervision of maximum delay in command direction of commands and set point

Configurable Maximum allowable delay of commands and set point

Transmission of integrated totals

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] Mode A: Local freeze with spontaneous
- [ ] Mode B: Local freeze with counter
- [ ] Mode C: Freeze and transmit by counter interrogation
- [X] Mode D: Freeze by counter interrogation command, frozen values reported

- [X] Counter read
- [X] Counter freeze without reset
- [ ] Counter freeze with reset
- [ ] Counter reset

- [X] General request
- [ ] Request counter group 1
- [ ] Request counter group 2
- [ ] Request counter group 3
- [ ] Request counter group 4

Parameter loading

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] Threshold value
- [ ] Smoothing factor
- [ ] Low limit for transmission of measured
- [ ] High limit for transmission of measured

Parameter activation

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [ ] Act/deact of persistent cyclic or periodic transmission of the addressed

Test procedure

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

- [X] Test procedure

File transfer

(station-specific parameter, mark '**X**' if function is used)

File transfer in monitor direction

☒ Transparent file

☒ Transmission of disturbance data of protection

☒ Transmission of sequences of events

☒ Transmission of sequences of recorded analogue values

File transfer in control direction

☒ Transparent file

Background scan

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

☐ Background scan

Acquisition of transmission delay

(object-specific parameter, mark '**X**' if function is only used in the standard direction, '**R**' if only used in the reverse direction, and '**B**' if used in both directions)

■ ~~Acquisition of transmission delay~~

Definition of time outs

Parameter	Default value	Remarks	Selected value
t_0	30s	Time out of connection establishment	N.A.
t_1	15s	Time out of send or test APDUs	Configurable
t_2	10s	Time out for acknowledges in case of no data messages $t_2 < t_1$	Configurable
t_3	20s	Time out for sending test frames in case of a long idle state	Configurable

Maximum range for all timeouts: 1s to 255s, accuracy 1s

Maximum number of outstanding I format APDUs k and latest acknowledge

Parameter	Default value	Remarks	Selected value
k	12 APDUs	Maximum difference receive sequence number to send state variable	Configurable
w	8 APDUs	Latest acknowledge after receiving w I-format APDUs	Configurable

Maximum range of values k: 1 to 32767 $(2^{15}-1)^2$ APDUs, accuracy 1 APDU
Maximum range of values w: 1 to 32767 $(2^{15}-1)^3$ APDUs, accuracy 1 APDU (Recommendation: w should not exceed 2/3 of k).

Port number

Parameter	Value	Remarks
Port number	2404	In all cases

RFC 2200 suite

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

- [X] Ethernet 802.3
- [ ] Serial X.21 interface
- [ ] Other selection from RFC 2200: GPRS

APPENDIX A
Test Results Chart

	Record the Conformance Test Procedure result for each of the supported configuration parameter values on the right	Station Type		Direction	
	√ indicates the Test Procedure PASSED for that configuration value. FAIL indicates Test Procedure failed for at least one of the Test Cases. N.A. indicates that configuration value is not supported by the device. Empty indicates the Test Procedure was not performed. (There should be no empty boxes when testing is complete).	Controlling station	Controlled station	Normal Direction	Reversed Direction
Frame length	**5.2.0.1 Maximum length L (control direction)**	**N.A.**	√	√	**N.A.**
	5.2.0.2 Maximum length L (monitor direction)	**N.A.**	√	√	**N.A.**
Common Address of ASDU	**5.2.0.70 Two (2) octets for Common Address of ASDU (CASDU)**	**N.A.**	√	√	**N.A.**
Information Object Address	**5.2.0.80 Three (3) octets for Information Object Address (structured or unstructured)**	**N.A.**	√	√	**N.A.**
Cause of Transmission	**5.2.0.90 Two (2) octets for COT field (2nd octet is Originator address)**	**N.A.**	√	√	**N.A.**
Tests on Transport Provider Level	**5.3.1.1 IP Frame**	**N.A.**	√	√	**N.A.**
	5.3.1.3 TCP Frame	**N.A.**	√	√	**N.A.**
	5.3.1.10 CS104 Frame Layout	**N.A.**	√	√	**N.A.**
	5.3.1.20 CS104 I-Format APDU	**N.A.**	√	√	**N.A.**
	5.3.1.25 CS104 S-Format APDU	**N.A.**	√	√	**N.A.**
	5.3.1.30 CS104 U-Format APDU	**N.A.**	√	√	**N.A.**
	5.3.1.50 Transmission Procedure	**N.A.**	√	√[3,4]	**N.A.**
	5.3.1.70 Transmission Control Using START/STOP	**N.A.**	√	√	**N.A.**
	5.3.1.90 Time Out Intervals	**N.A.**	√	√[5]	**N.A.**
Verification of Data Unit Identifier	**5.3.2.1 Type Identification**	**N.A.**	√	√	**N.A.**
	5.3.2.10 Cause of Transmission	**N.A.**	√	√	**N.A.**
Verification of	**5.3.3.10 ASDU 1 Single-point Information**	**N.A.**	√	√[6]	**N.A.**

[3] The tested combinations of values for **k** and **w** are respectively: 16/12, 12/8 and 6/4

[4] REMARK: The DUT is able to configure values up to 255 for K and W.

[5] The tested values for the timeouts are: t_1: 10, 15, 20 [s], t_2: 8, 10, 15 [s], t_3: 20, 25, 30 [s]

[6] IV bit is implemented only.

	Record the Conformance Test Procedure result for each of the supported configuration parameter values on the right		Station Type		Direction	
	√ indicates the Test Procedure PASSED for that configuration value. FAIL indicates Test Procedure failed for at least one of the Test Cases. N.A. indicates that configuration value is not supported by the device. Empty indicates the Test Procedure was not performed. (There should be no empty boxes when testing is complete).		Controlling station	Controlled station	Normal Direction	Reversed Direction

About DNV GL

Driven by our purpose of safeguarding life, property and the environment, DNV GL enables organizations to advance the safety and sustainability of their business. We provide classification and technical assurance along with software and independent expert advisory services to the maritime, oil and gas, and energy industries. We also provide certification services to customers across a wide range of industries. Operating in more than 100 countries, our 16,000 professionals are dedicated to helping our customers make the world safer, smarter and greener.
